DRINKING WATER WARNING

E. coli may be present in the [System]'s water

BOIL YOUR WATER THREE (3) MINUTES BEFORE USING

A water sample collected on 8/5/2020 detected E. coli bacteria. Additional sampling is being conducted to verify these results. These bacteria can make you sick, and are a particular concern for people with weakened immune systems.

Bacterial contamination can occur when increased run-off enters the drinking water source (for example, following heavy rains). It can also happen due to a break in the distribution system (pipes) or a failure in the water treatment process.

What should I do? What does this mean?

- **DO NOT DRINK THE WATER WITHOUT BOILING IT FIRST.** Bring all water to a boil, let it boil for three minutes (one minute is sufficient below 5000 ft elevation), and let it cool before using, or use bottled water. Boiled or bottled water should be used for drinking, making ice, brushing teeth, washing dishes, and food preparation until further notice. Boiling kills bacteria and other organisms in the water.
- *E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a greater health risk for infants, young children, the elderly, and people with severely compromised immune systems.*
- The symptoms above are not caused only by organisms in drinking water. If you experience any of these symptoms and they persist, you may want to seek medical advice. People at increased risk should seek advice from their health care providers about drinking this water.

What is being done?

Flushing of the water system and follow up sampling is being performed.

We will inform you when tests show no bacteria and you no longer need to boil your water. We anticipate resolving the problem within 7 Days.

For more information please contact (Water System name :)
